

✓ Learning Label Encoder

```
1 import pandas as pd
2 from sklearn.preprocessing import LabelEncoder
3
4 # Define the list of country names (7 countries, including user's examples)
5 countries = ['India', 'USA', 'China', 'Russia', 'Germany', 'France', 'Japan']
6
7 # Create a DataFrame for better visualization
8 df = pd.DataFrame({'Country': countries})
9 print("Original Data:")
10 display(df)
```

Original Data:

	Country
0	India
1	USA
2	China
3	Russia
4	Germany
5	France
6	Japan

```
1 # Initialize LabelEncoder
2 label_encoder = LabelEncoder()
3
4 # Fit and transform the 'Country' column
5 df['Encoded_Country'] = label_encoder.fit_transform(df['Country'])
6
7 print("\nData after Label Encoding:")
8 display(df)
```

Data after Label Encoding:

	Country	Encoded_Country
0	India	3
1	USA	6
2	China	0
3	Russia	5
4	Germany	2

```
1 alphabet_numbered = []
2 for i, char_code in enumerate(range(ord('a'), ord('z') + 1)):
3     char = chr(char_code)
4     number = i + 1
5     alphabet_numbered.append(f'{char}{number}')
6
7 print(alphabet_numbered)
```

```
['a1', 'b2', 'c3', 'd4', 'e5', 'f6', 'g7', 'h8', 'i9', 'j10', 'k11', 'l12', 'm13', 'n14', 'o15', 'p16', 'q17', 'r18', 's19', 't20', 'u21', 'v22', 'w23', 'x24', 'y25', 'z26']
```
